Most likely not. Stan Gordon said that witnesses said it's speed and trajectory changed as it descended.

Regarding the magnetic anomalies present on the ground after UFO sitings, one would think that atmospheric magnetic and gravitational field anomalies should be monitored on a large scale.

Mike

Well, I was too amused to be scared, so I ordered the catalog. I
hope I don't get on the 'New Age Junk Mail List', but I gave it a read with
an open mind. It is a very interesting bunch of descriptions of the manuals
you can buy (for 10.00 apiece, discount rates for more than 4). From some of
the wording, however, it sounds like the guy's name is Hate-On. There are a
couple of the 80 to 110 page manuscripts that deal with such topics as
'Zionist world takeovers', "Faked scud attacks on Israel" and George Bush's
'Secret Constitution' ala trilaterals, etc (that may be true, there is enough
barely plausible facts mingled in to spark much paranoia). From the ranting
anti-semetic tone, and the desire to have a govt. 'as the founders of the
constitution intended under God's law', as well as subtle attacks on the
Brittish govt, it sounds to me like a slightly New Age version of the pap that
Lyndon LaRouche and his 'New Federalist' gay bashing, jew hating white people's
party has been spouting of late. The substantiating material for the claim
of gay bashing is a volume that has how 'Sodomy reduced the immune system' and
'AIDS is the last great plague of the Earth' or some such items. Talked about
how there will be concentration camps in the US, how we will see stuff like in
Russia (removing large bills from the economy, then going plastic, which may
happen regardless of who is in charge).

Before the true believers blitz me with flames, you may ask ' How can
you claim to have given it a read with an open mind, when you obviously have
anti-Haaton sentiment?' I don't hate anybody, I truly read the material I
received, and evaluated it with the idea of looking for substantiating proof
within the literature, there was none, and I was not about to shell out 10.00
each to look further. The initial claims made were, in my opinion only,
a new age slant to a very old game ----- hate mongering and duping the weak
minded out of their money as well. If these people aren't already hooked into
Lyndon LaRouche's political machine, it wouldn't suprise me if they soon do,
their statements are that similar. Don't believe me? Call that 800 number for
yourself, order the catalog. Make them pay 0.52 to mail it and satisfy your

curiousity.   Let me know what you think of it when you get it.

   Best Regards,

    K.M.

Subject: fireball report (few details yet)
Date: 7 Mar 91 08:20:35 GMT

From: vanth!jms@amix.commodore.com (Jim Shaffer)

(and now for something completely different)

I just heard on the local news at noon that a huge fireball with a
'reddish-green' (whatever that is!) trail was seen from Philadelphia to New
York this morning, apparently lasting for about six seconds.

* From the disk of: | jms@vanth.uucp | 'Speeding through the
Jim Shaffer, Jr. | amix.commodore.com!vanth!jms | universe, Thinking is
37 Brook Street | uunet!cbmvax!amix!vanth!jms | the best way to travel.'

+From: Clark.Matthews@paranet.FIDONET.ORG (Clark Matthews)
+
+Perhaps they were on to the same thing? Worth noting that there is
+much anecdotal evidence for Keely's devices, but we can't test them
+today. Supposedly his 'airship' is in Chicago somewhere --
+interesting to get hold of THAT, wouldn't you say?

Yes it would be interesting. I wasn't trying to say that I think Keely was full of it, only that his writing style (which I don't pretend to understand) makes him certainly look like it.

+Well, I don't know if Tesla turbines are safer than conventional ones
+because of the stresses involved. Models are much more efficient,
+however. There's a fellow on KeelyNet who's building one, you know.

I read one file on the Tesla BBS that claimed that they were safer because if one of the discs broke up it would be swept out the exhaust port rather than flying through the sides of the unit. Now that I think about it, that doesn't make a whole lot of sense. But it also said that they could be run at very high speeds without breaking up.

+As to the psychic components of all this, mentioned in your message,
+check out the Keely Files MIND1-8 and VEDA. They're about this
+stuff, including direct brain stimulation via microwave,
+electromagnetism, etc. One of them is by Persinger, whose
+electrical football helmet produced repeatable phychic results in
+Montreal.

I read the Veda file and thought it was interesting philosophically, but I wish we had some evidence that all these things in the ancient writings actually existed.

The last I heard, Persinger was a skeptic and the object of his helmet was to demonstrate that certain phenomena were hallucinations caused by geo-piezo-electrically-generated EM acting on the brain. I even heard he induced an alien abduction experience. (It wouldn't account for those that leave implants or scars, of course!) Do you mean that he induced something that was proveably not the result of the subject's own mind? (I guess I should get those files. I've got to call the Vangard board one of these days and see what they're up to down there, too.)

+
+America West HAS been censored (had you heard of them?) as no TV station
+or national newspaper will accept their ads. The Pleidians say that

That's the decision of the TV stations and newspapers. They have the right to make that decision. (I only wish they'd refuse all the astrology crap and the explosion of Apocalyptic interpretations of Nostradamus.)

+the scribe (I did NOT call her a channelor nor a psychic) has been

Nor did you explain the difference, even when asked. I propose that there is none. I don't necessarily mean that in a derogatory way, but see about four paragraphs down for what I do mean.

+killed (heart stopped) several times with 'beam weapons.' They monitor
+her constantly and can revive her. That is an example of their
+interfering if directly requested. I heard
+Dan Rather quote Boris Yeltzin once as saying, 'the KGB has beam weapons
+that can stop my heart.'

Can you give any reference for this quote? It's very interesting if true, but it needs to be tracked down. (I have also heard [from an unidentified source!] that the CIA can cancel out your brain waves. I don't consider it technically possible, especially in the manner it was described [via a 'bug' in a telephone receiver.]) Perhaps you could cause nervous system effects with some sort of radio waves. I'm not a physicist, or a biologist. But I suspect it would have to be very strong to work from any sort of distance.

+How to contact Hatonn? You don't need an appointment. You must go
+to a quiet place where you can hear your inner voice. Just call on
+him. I'm not saying he will appear in full 9 1/2 foot radiance; I'm
+not saying he won't. I think that is his choice. You have to remember
+that just because the response is not in the form that you expect/want,
+that doesn't mean the response was not made. Before you do, imagine
+yourself cloaked in light. Ask an honest question, and listen attentively
+for the reply. It's easy to call; it's admittedly harder to hear.

A fairly standard practice. But to get back to the point I've tried to make several times now, how do you know that anything you experience isn't merely coming from your own subconscious (i.e., a kind of waking dream.)

PLEASE note, I'm *not* questioning the existence of psychic phenomena, and I'm *not* questioning the value of meditation as a spiritual exercise, and I'm *not* arguing 'psychic' vs "scalar wave receiver" vs "quantum interconnectedness', I'm asking 'How do you know a true psychic vision from a product of your own (conscious or unconscious) mind?' I've met some neo-pagans who acknowledge that not everything that you perceive in an altered state of consciousness is necessarily psychic, but there are far more New Age people who seem to take everything as Gospel (pardon the mixed religions.)

+I will leave you with something to chew on. I recall in my childhood
+when watching the lunar modules returning to earth that they had to wait
+a while for the module to cool while it was in water before opening.
+Then, the astronauts had to be helped out of the module because
+weightlessness had screwed up their bearings--they could not walk at all.
+
+I was at Edward's Air Force base when the very first shuttle returned to
+earth. I remember the immediately captain bounding down the steps and
+running all about the place like a gazelle. Apparently, one of the
+announcers on a network commented on his athleticism. This same
+announcer, a former astronaut or NASA person--in other words, a knowledgeable
+person, commented when he first saw the shuttle, 'That doesn't look
+like it's been in space!'

I think I can squash this line of speculation before it gets anywhere. The shuttle has heat-resistant tiles on it. They dissipate the heat *very* fast. And you're right, they don't burn and thus don't show signs of re-entry. I'm not saying this because it's what NASA says, I'm saying it because I've seen it demonstrated about 10 feet in front of me! A man held a torch to one of the tiles until it was glowing red, then in little more time than it took to shut off the torch and set it down, he held the heated side of the tile against his bare hand. No burns! No oxidation of the tile either, despite glowing red. (And it quit glowing red the instant he removed the torch.) I suspect that whoever made the 'doesn't look like it's been in space' comment meant it as a *compliment* for the shuttle's fine technology.

The capsules that came back from the moon were a different story. I don't know what they were made out of, but they looked like they were bare metal on the top. There's a heat shield on the bottom (the side that comes in first, to slow it down by simple aerodynamics) and although I don't know what it was made of either, I believe that it actually did partially burn away. But for all their screw-ups, don't think for a second that NASA couldn't have invented one good thing in ten years!

As for the effects of weightlessness: First, on the shuttle you can move around and exercise. On the lunar capsules you just had to sit there. Even though there's no gravity in either case, I think just moving around would help to prevent getting your bearings screwed up. If I'm wrong, correct me, but that's not my main point anyway. My main point is that although I've never seen a shuttle landing in person and I don't remember much of seeing it on TV, I doubt that anyone immediately came bounding out of it when it landed. Don't they have to check the thing for hydrazine

before they let the astronauts come out? It's deadly in very small
quantities, you know. I think they'd have time to get out of their seats
and get re-oriented to gravity before leaving.

Subject: Long Island UFO
Date: 7 Mar 91 04:20:00 GMT

Preliminary reports indicate sightings of a large, spherical, slow-moving object with four "exhaust-like" lights and vapor trails. The object was whitish blue and was observed to change course and possibly altitude.

It was first observed over the borough of Queens in New York City at around midnight 3/5/91 and was last observed by two police officers in Mastic in eastern Long Island three hours later.

Observations were reported from aircraft and witnesses on the ground.

Further updates will come as soon as the information is available & verified.

Best,
  Clark

Michael, some of the files are rather lengthy but this one, in particular, should pique the interest and imagination of ParaNet's readers & participants. Followers of the "Philadelphia Experiment" should be particularly intrigued.

The subject of this file is the so-called Resonant Gravity Field Coil. The coil is a device that ostensibly warps spacetime -- "ripping" the fabric of time, as it were. The file provides some rather crude graphics for building such a device and some glowing -- if vague and unsubstantiated -- experimental results.

Briefly, toroidal coils like this seem to have the potential of creating very unusual, localized field forces. By all accounts, these devices are also VERY DANGEROUS.

I have data on a catastrophic "explosion" (for lack of a better word, since this coil is built from inert materials) in the New York area and have heard accounts of similar mishaps in Philadelphia (2) and Toronto (1).

Properly, I should convey the warnings of unintended consequences to such experiments -- including violent dissociation of rooms and buildings and things disappearing in the field generated -- but these anecdotes are not verifiable. Still, the potential of devices like this seems to be enormous.

The theory behind the device is elusive: If it actually transcends time, it points to radically different ideas of reality and conceptions of gravity and time. Notable among these is the theory of a Holographic Universe and variations on the old Aether theory.

I'll post some more when there's been some comment on the RG Coil.

Best,
  Clark

Theory, concept, and Idea by: ??????????????????

NOTICE: Within this file will be presented a potential method of altering the spatiotemporal continuum as one desires. I take no responsibility for any use or misuse of this information, whether harmful or otherwise. The effects of this device, if used in a careless manner, can be EXTREMELY DANGEROUS.

Gravity Resonance? What is this nut talking about????

You are probably thinking, "how can gravity possibly be resonant?"

This is a good question. As discovered by Thomas Townsend Brown, electricity is directly related to gravity (see his U.S. patents 1,974,483, 3,187,206 in particular.)

If this is so, it is most likely a vectorial relationship (law of

opposites), and since there is already an electromagnetic vector (2 dimensional), a gravitational vector would be at 90 degrees to both the magnetic and the electric vectors (since we are in a 3 dimensional space.)

The gravitational vector is like the "duration in time" of the electric and magnetic vectors. There are also, in addition to scalar electric and magnetic waves

(see Bearden, Thomas E. "Toward a new electromagnetics: part IV: vectors and mechanisms clarified. Tesla Book Co., Millbrae, California, 1983.

This work, however, fails to mention gravity waves, although it does mention controlling gravity), there are also scalar gravitic waves

(see Ford, L.H and A. Vilenkin. "A gravitational analogue of the Aharanov-Bohm effect." Journal of Physics A. Mathematical, Nuclear, and General. (Great Britain). 14(9), Sep. 1981. p. 2353-2357.)

Okay. So There are gravity waves.
How can resonating them control reality?

All of the above has been proven; this is where basically theory comes in. There has been much supposed experimental proof of these effects, however all current research is, unfortunately, proprietary, and it is extremely hard to come by anything helpful.

The only good sources of information are some small mail order book stores, and no one store has everything.

One example of publicized experimental proof is the information regarding the largely ignored Biefield-Brown effect, whereby gravity can be nullified and even reversed due to electric charge

(see Thomas Townsend Brown, Above patents), and the book on the Philadelphia experiment (and NOT THE MOVIE! The movie was fiction, the book is an attempt to analyze what little fact is known.)

The true Philadelphia experiment, if it actually occurred, used a Navy ship degausser modified to act as some type of resonant gravity vector coil.

The actual theory is that, since electricity can be "transmitted" through the ether through electric scalar and vector waves, and magnetic energy through magnetic scalar and vector waves, why not gravitational scalar and vector waves, if they do exist (law

of opposites)?

A gravity wave is the temporal "shape" of the electric and magnetic vector (I hope this is a good explanation!), and by changing this shape you are changing the molecular construction of the matter (or lack thereof) transmitting the waves.

Also, since there are an infinite number of parallel, real universes

(see Hypernumbers II, by Charles Muses, January 1978
"Applied Mathematics and Computation", and his introduction to Jerome Rothstein's "Communication, Organization, and Science," The Falcon's Wing Press, Indian Hills, CO, 1958),

the gravity vector coil MAY allow the psychic (scalar electromagnetic brain wave) postulation of reality through the G-vector. Thiscould also be done with a computer, but both are beyond the scope of this paper.

I will now present the plans for the construction of a simple G-vector coil. What you do with it from here is up to you, show it

Part 2 of 4.

to your physics teachers and have them look up the references and watch their eyes pop as they find out the speed of light is NOT constant.

This, actually, is the hardest part. You will either have to spend a lot of $$$ at a plastics company or have some good friends to get but one of the parts needed, the others should be fairly easy.

Listed in order of availability

(2) 50 VDC (DC-10 MHZ preferred, but...) @ 10A, 50KV isolated

power supplies

(parts list for those:)

(2) 110 VAC to 48 VDC @ 10A Isolated stepdown transformers (500 watt)

(2) 100V PIV rectifier diode

Optional (2) Heatsinks for above

(2) 0-120 VAC @ 10A variacs (variable autotransformer)

(2) 80-100V @ 1000uF electrolytic capacitors

Optional (1 or 2) Case to hold it all in

(1) 25-100 KVDC (again, DC-10 MHZ preferred...) @ 100-400 uA (not necessarily variable) 50 kV isolated power supply

(parts list)

(1) 10-12 KV @ 20-30 mA neon sign transformer

(4) TV HV diodes - 12-14 KV PIV

(4) HV capacitors, 500-1000 pF @ 10 KV

(1) 0-120 VAC @ 10A variac (variable autotransformer)

(1) Case to put it all in

about 7500 feet of #16 Guage heavy Formvar magnetwire

a lot (probably 5000 feet) of #20 or #22 magnetwire

some fiberglass tape

some plastic tape

TV HV corona dope

And, the clincher:

(1) Hollow plastic dia., about 30"-32" outside diameter, 24-26" inner diameter, and about 4"-6" thick.

It must be hollow, thermosetting plastic, with supports for an internal coil of wire, and two holes for the wire to leave, spaced to avoid electrical discharges.

It must be boiling wax-tight, preferrably with a gasket.

And it should be openable, at least into 4 sections, with screwholes (and gaskets if available.)

You also need enough of equal portions of Carnubura (sp) beeswax, and paraffin wax to fill the inside.

Construction

(1) Wind a 28" (about, must center inside the hollow part of the plastic donut) "hoop" coil of the #16 magnetwire. (see Illustration 1)

(2) Wrap first with fiberglass and then plastic tape, and then dip it in TV HV corona dope. Allow to dry.

(3) Place the coil inside the hollow donut.

(4) Seal the donut, allowing an opening for the wax to be poured into.

(5) Pour the wax into the donut, leaving as little air space as possible.

(6) Seal the donut, adding any extra wax.

(7) Wrap approximately one layer of the #20 or #22 guage magnetwire over the outside of the donut.

(8) Coat with HV corona dope.

(9) You are finished with the coil. It should look similar to illustration 2.

See illustration 3 for a cutaway view.

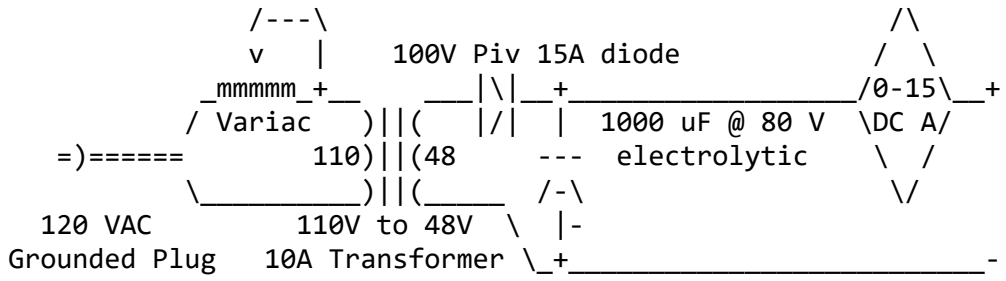
Building The Power Supplies

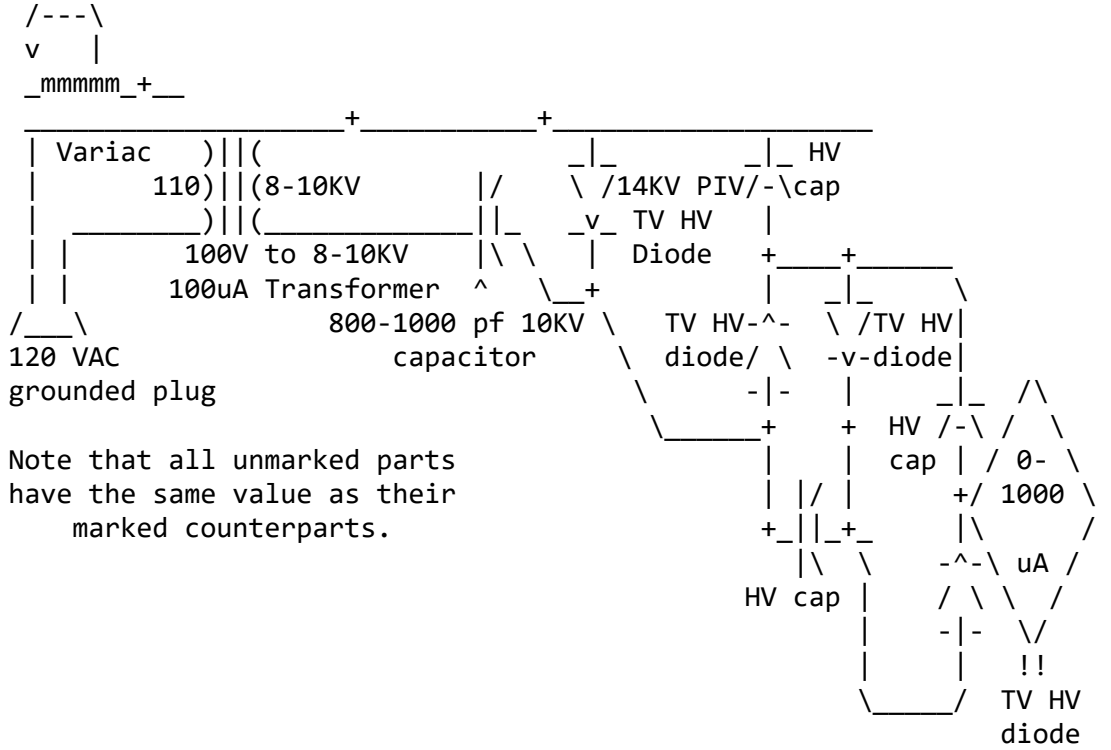
If you are unfamiliar with electronics, you may need some help with this section, as I am only presenting the schematics. Here they are:

For both 50VDC power supplies:



(2) of these are required. Note that the stepdown transformer must be 50kv isolated.

For the 100 KVDC power supply:



| Usage |

To connect the power supplies to the coil, connect the wires leading out of the donut (from the inner coil) to one 50 VDC power supply.

Part 4 of 4.

The polarity, at this stage, does not matter.

Next, connect the leads from the outer coil to the other 50 VDC power supply.

Do NOT turn either of them on! Now, connect one of the leads of the inner coil to one terminal of the 25-100 KV power supply, and connect one lead of the outer coil to the other terminal of the 25-100 KV power supply.

Thats it!

Now, the hard part. You will have to figure out some way of modulating the fields. This could be done through stepper motor control of the variac, or through the insertion of a probe coil (probably just a ferrite rod wrapped with a few hundred turns of wire) into the center of the donut hole.

This would then be modulated with whatever electromagnetic signal you'd want to impress upon the field.

Through careful experimentation, you should be able to produce some very interesting effects, such as extreme gravity, bending of metal within the field, spontaneous materialization of ?, etc.

Note that the purpose of the wax is to act as a molten dielectric, so don't be surprised when it starts boiling.

Thats why the donut form must be made out of thermosetting (or any kind that doesn't melt near the temperature of boiling wax) plastic.

Have phun, and don't do anything you wouldn't want perpetuated throughout your subjective reality!

Appendix to the above paper.....by Joseph John Misiolek

****

There are two modifications to the above device which should make the effect of the unit more powerful, while at the same time making it more safe for the operator to conduct his/her research.

1. In place of the wax in the coil being used as a "molten dielectric", it would be advantageous to use Glycerine instead.

   The "scorch field" set up between the two coils using the 25-

   100kvdc supply will be approx. 25 times greater in intensity than with the wax.

   While the dielectric constant (k) of wax is less than 3, the (k) of Glycerine is about 56.

   Also, the semi-liquid state that Glycerine maintains at room temperature will prove to be an effective heat-sink for the inner coil. Glycerine is an emollient, and can be obtained from most drug stores.

2. The Modulator coil (250-300 turns) on ferrite core to be placed into the interior of the coil shall be replaced by a coil larger in diameter than the outer coil of the present unit (as herein described) and shall be placed outside the units' outer coil.

   This will give a more stable field configuration, while confining the gravitational effects to the interior of the device.

   These two modifications, while increasing the units' power, will also provide a level of safety not to be had in the original

design.

A word of caution! --------

While operating this device, it would be wise to secure a non-interruptable power supply for it.

If, while the fields were at their maximum output, the power to the coils were to be suddenly interrupted, a very serious condition could arise as the distorted region of spacetime surrounding the coil "cut-loose" into the surrounding spacetime beyond the coils influence.

A "pulse" of distorted spacetime might, under these conditions, leave the coil at high velocity, and inflict great damage to the surroundings near the coil. (Including the operator)

DON'T SAY THAT YOU WEREN'T WARNED!!!!!!!!!!!!!
